

George Washington Carver

George Washington Carver was born a slave in the 1860's. A year after his birth, slavery was outlawed. Carver grew up to become a scientist and the first African American to earn a Bachelor of Science degree for agricultural science.

Carver was dedicated to nature and to improving the lives of farmers. He invented "crop rotation," which was the practice of growing plants in between crops that restored nutrients to the soil and improved the yield of the crops.

Carver believed that nothing in nature should be wasted. color the forest picture and add your favorite animal in the empty space
