

Savonala Horne

Savonala “Savi” Horne is an environmentalist who provides help to financially distressed farmers and landowners. She also advocates for sustainable farming techniques, such as the use of windmills and other methods of minimizing pollution, wise water management, and the development of healthy soil.

Windmills have been used for centuries to pump water and mill grain. They are sustainable sources of energy that create power from the wind alone. Recently, more modern wind turbines have been used to generate electricity for farms.

Color the windmill!
